

Holocene volcanoes and plate boundaries

1,214 Smithsonian Global Volcanism Program records from the supplied Holocene catalogue snapshot.
Holocene catalogue coverage; not a list of volcanoes currently active or erupting. Snapshot supplied 25 October 2026.

Equal Earth projection (EPSG:8857). Symbol sizes distinguish categories, not earthquake magnitude.
Catalogue records can represent volcanic fields and complexes as well as individual volcanoes. No current eruption status is inferred.
Plate-boundary lines do not represent every active fault. A global pattern does not predict the location or timing of the next earthquake.
